Section 1: Coding

# 1. Problem Statement

Imagine a bustling coffee shop, where customers are placing their orders for their favorite coffee drinks. The cafe owner Sheeren wants to efficiently manage the queue of coffee orders using a digital system. She needs a program to handle this queue of orders.

You are tasked with creating a program that implements a queue for coffee orders. Each character in the queue represents a customer's coffee order, with 'L' indicating a latte, 'E' indicating an espresso, 'M' indicating a macchiato, 'O' indicating an iced coffee, and 'N' indicating a nabob.

Customers can place orders and enjoy their delicious coffee drinks.

**Input Format** 

The input consists of integers corresponding to the operation that needs to be performed:

Choice 1: Enqueue the coffee order into the queue. If the choice is 1, the following input is a space-separated character ('L', 'E', 'M', 'O', 'N').

Choice 2: Dequeue a coffee order from the queue.

Choice 3: Display the orders in the queue.

Choice 4: Exit the program.

### **Output Format**

The output displays messages according to the choice and the status of the queue:

#### If the choice is 1:

- 1. Insert the given order into the queue and display "Order for [order] is enqueued." where [order] is the coffee order that is inserted.
- 2. If the queue is full, print "Queue is full. Cannot enqueue more orders."

#### If the choice is 2:

- 1. Dequeue a character from the queue and display "Dequeued Order: " followed by the corresponding order that is dequeued.
- 2. If the queue is empty without any orders, print "No orders in the queue."

#### If the choice is 3:

- 1. The output prints "Orders in the queue are: " followed by the space-separated orders present in the queue.
- 2. If there are no orders in the queue, print "Queue is empty. No orders available."

#### If the choice is 4:

1. Exit the program and print "Exiting program"

If any other choice is entered, the output prints "Invalid option."

Refer to the sample output for the exact text and format.

## Sample Test Case

```
Input: 1 L
    1 E
    1 M
    10
    1 N
    10
    Output: Order for L is enqueued.
    Order for E is enqueued.
    Order for M is enqueued.
    Order for O is enqueued.
    Order for N is enqueued.
    Queue is full. Cannot enqueue more orders.
    Orders in the queue are: L E M O N
    Dequeued Order: L
    Orders in the queue are: E M O N
    Exiting program
Answer
    #include <stdio.h>
    #define MAX_SIZE 5
    char orders[MAX_SIZE];
    int front = -1;
    int rear = -1;
    void initializeQueue() {
      front = -1;
      rear = -1;
```
